Sec No-10	Team No-27	Project Title-SMART ATTENDANCE SYSTEM USING FACE RECOGNITION
------------------	-------------------	---

1. Abstract

The **Smart Attendance System Using Face Recognition** is a database-driven system designed to automate the traditional process of recording student attendance. In the existing manual system, attendance is generally recorded using registers or manually operated digital systems, which can be time-consuming, prone to human errors, and difficult to manage for a large number of students. The proposed system uses **face recognition technology** along with a centralized database to make attendance recording faster, more accurate, and reliable. Before using the system, the details of each student, including **name, roll number, department, section, and registered face data**, are stored in the database.

The attendance process begins when a student enters their **department, section, and roll number** into the system. After the student details are verified, the system redirects the student to a dedicated **face-scanning page**. The student's face is captured through a camera and compared with the registered facial data associated with the student's information. If the captured face successfully matches the registered face, the system verifies the student's identity and records the attendance in the **MySQL database**. The system then displays a confirmation message such as "**Attendance Successfully Provided.**" If the face does not match or the verification fails, attendance is not recorded and an appropriate error message is displayed.

The system is developed using **HTML, CSS, and JavaScript** for the frontend interface, while **MySQL** is used for storing and managing student information and attendance records. The database provides organized storage and easy retrieval of student and attendance data, making the system suitable for efficient attendance management. By combining database management with face recognition, the proposed system can reduce manual effort, minimize attendance errors, discourage proxy attendance, and provide a faster and more convenient method of maintaining attendance records. Overall, the project demonstrates how **DBMS and face recognition technology** can be integrated to create a modern, efficient, and reliable smart attendance management system.

2. Team Details

Roll Number(s)	Name of the Student	Signature
2520090092	V.SHIVA VENKATA SAI	
2520090097	V.SATHVIK	
2520090109	R.PRANAV	

3. Frameworks / Platforms / Software Used

The **Smart Attendance System Using Face Recognition** uses a combination of web technologies, database software, and development tools to build an efficient attendance management system. **HTML** is used to create the structure of the web pages, while **CSS** is used for designing the interface, layouts, colors, and overall appearance. **JavaScript** is used to provide interactivity and manage user actions such as entering student details, accessing the camera, initiating the face-scanning process, and displaying verification results. **MySQL** is used as the database management system to store and manage student information such as name, roll

number, department, section, registered face data, and attendance records. The project can be developed and managed using **Visual Studio Code (VS Code)** as the primary development environment. Together, these technologies provide the frontend interface, database storage, and necessary software environment for implementing the smart attendance system.
